The slimmed down and optimized version of Prestige Software's Power Suite is a software application whose purpose is help you improve your system performance by getting rid of junk files and unnecessary registry items, applying several optimization modes, and updating drivers. Improve the performance of your computer Although it comes bundled with many dedicated parameters, it sports a clean and intuitive layout that allows you to carry out most operations with just a few clicks. There are three scanning modes available: "simplifast," "simpliclean" and "simplisafe". At the end of each scanning operation you are given a short overview about the problems found present on your computer, such as damage level and number of errors. Optimize and clean your hard drive using three modules The first mode, "simplifast," gives you the possibility to optimize startup items, Windows services, and Internet connections, defragment drives, as well as activate the "High-Speed" feature for running complex application with full speed. The cleaning operations are accomplished via the second mode, "simpliclean," which enables you to delete trash files and recycled items, reduce power consumption by shutting off energy wasting processes running on your system, wipe out registry items, and defragment the registry. The third option, Simplisafe, lets you clean Internet traces (e.g. temporary files, website addresses, cookies), update drivers and other utilities installed on your computer, recover deleted data, as well as shred files permanently by overwriting them with random numbers. Autopilot mode with one-click optimization There's also an autopilot feature that provides a one-click optimization module which spares you the trouble of configuring settings for each of the three components. It can monitor and clean Internet traces and the disk space before it gets full, update drivers in case of critical system warnings, optimize background processes, and prevent standby mode. During our testing we have noticed that the program accomplishes the scanning operation pretty quickly and without errors throughout the entire process. However, it eats up CPU and memory, and stresses up the disk, so the overall performance of the computer may be burdened.
